

Important Information for Project Submission and Evaluation

Document format to submit:	ZIP, with two PDF documents (one for the work report and another for the presentation).
Assessment mode:	On-line
Assessment max time:	30 minutes (10 minutes for presentation and 20 minutes for discussion)
Grade information:	After the evaluation committee's decision

PREPD Project Guidelines

Document	
Item	Some Questions to Consider
Background and context for the project being conducted, as well as its rationale	--What caused the problem to arise? Are the causes recent, or have they become more acute recently? --Are there deficiencies in current practices or in the existing solutions of a given organization that justify the work? Do sources (including business background), studies or data support them? --Are there restrictions or limitations in financial, human, technological resources or others that will impact how the problem will be addressed? Are they recognised by the community or by the stakeholders?
Analytical, critical, and ethical interpretation of the problem to solve	--Are stakeholders and their interests considered? --Is there a clear description of the problem? --Are possible societal impacts from attempts to resolve the problem considered? --Are the consequences of not solving the problem explained? Are mentioned the expected contributions from resolving the problem? --Are there any concerns about legal and social responsibilities evident? --Is the problem analyzed from multiple perspectives, exploring potential inconsistencies or preconceived ideas in the available information? --Are scientifically documented pieces of evidence of the problem or related statistics from credible sources mentioned? --Did the student analyze some potential implications of attempts to resolve the problem?

Document	
Item	Some Questions to Consider
Clear, well defined, and feasible objective(s), research process, method(s) and question(s)	--Are objectives clear and specific? --Are objectives closely aligned with the research questions or problem statement? --Do objectives address a gap in the existing knowledge or contribute to a relevant issue? --Does the research methodology support the achievement of the objectives? Are the research methods well-suited to address research questions and objectives? --Are objectives realistic and attainable within the existing time and resource constraints? Are limitations or boundaries associated with objectives identified? --Are steps taken to minimize bias, errors, and other sources of invalidity described? --Is it clear how the research questions relate to existing literature, address gaps, or extend previous research?
State-of-the-art review -- includes the most recent developments, technologies, trends, and challenges in the specific fields related to the project --It must describe how it was conducted: the methods applied and how	--Is a literature review method identified and followed? --Is the maturity of sources considered? If grey literature is used, is its importance for the work justified? --Is there any critical analysis about what is presented? For instance, are similarities or differences between ideas/procedures/approaches highlighted?
Schedule of activities planned to complete the project	--Are the skills to be worked on for successful project completion recognised? --Does the planning include tasks associated with selected skills? --Are the elements on the project charter correctly considered in the project planning, such as stakeholders' management process, Objectives, Research Question(s), assumptions, restrictions? --Is scope correctly assessed with a level of detail based on deliverables and distributed among lifecycle (phases) aligned with the research method chosen? --Is the project schedule correctly realized, taking into consideration dates and duration estimates, main milestones highlighted and task dependency correctly integrated? --In the case applicable, is cost estimated and incorporated in the project plan? --Are monitor and control procedures detailed and reflected the needs of the project? --Are risks identified, analyzed and managed?
Document structure --main chapters and sections --an abstract, --a list of bibliographic references --a table of contents -- lists of abbreviations, images and tables	--Does the document organization promote its readability? --Does the transition between sections and chapters promote a sense of flow? --Are references used relevant? For example, are bibliographic sources identified and mentioned in the list of bibliographic references, including those for the images used? --Do all parts have a connection with problem and objectives?
Technical, scientific, writing accuracy of the content with consistency and appropriate references	--Is the content aligned with the theme and title? --Are there writing errors?

Document

Item	Some Questions to Consider
	--Are there sentences long (e.g., more than 30 words)? --Are there technical/scientific errors (see also questions related to "technical/scientific accuracy")? --Is there a consistency in formatting, font size, spacing, citation style, and margins? See also questions related to "quality of the visual materials".
Ethical considerations in research design, data collection, analysis, and reporting, with recognition of potential conflicts of interest and compliance with Ethical Boards and approval of ethics committees, whenever required	--Is the compliance with any Ethical Board mentioned (two are indicated at Moodle, but others may be more appropriate)? --Are permissions or approvals from relevant authorities, institutions, or organizations needed before conducting research in certain settings or with specific populations? If yes, were they obtained? --Are research participants fully informed about the research, their rights, and potential risks and benefits? --Are the privacy and confidentiality of participants safeguarded?

Presentation and Discussion

Item	Some Questions to Consider
Quality of the visual materials	--Are the image contents noticeable? If the visual elements contain text, are they readable without zooming them in/on? --Is the presentation document paginated?
Clarity and engagement of the oral presentation	--Was the student speaking naturally, facing the camera/audience? --Was the speech clear and at a good pace?
Technical/scientific accuracy	--Was jargon used? --Are technical terms used with proper explanations?
Conciseness and coverage	--Was the presentation completed within the allocated time without compromising the summary of the key aspects of the work developed so far?
Self-assurance and ability at arguing during the presentation	--Does the student provide clear and objective answers to the questions made by the evaluation committee?
