Mestrado em Engenharia Informática

Cybersecurity and Systems Administration

Context and Motivation

Why it matters

CI/CD services: operational infrastructure

Failures: block delivery and incident response

Diagnosis: required across multiple services

Current reality

Logs: scattered across systems

Correlation: weak across services

Decisions: incomplete signals

Problem Statement

Technical challenges

Architectural choices: multiple instrumentation patterns available

Telemetry integration: across CI/CD services

Mixed platforms: Linux and Windows

Design requirements

Docker access: leveraging container capabilities

Trade-off analysis: overhead vs visibility

Diagnosis: improving on-prem observability

Scope: heterogeneous containerized CI/CD on mixed OS

Research Gap

What the literature assumes

Cloud platforms: managed observability

Kubernetes focus: native patterns

Homogeneous: single OS environments

Gap in practice

On-premise: mixed OS deployments

CI/CD workloads: limited comparative evaluation

Trade-offs: instrumentation alternatives underexplored

Objectives and Research Question

Central question

How can an **integrated observability framework** be designed and evaluated for **heterogeneous containerized CI/CD** environments, and what are the **trade-offs** between different instrumentation approaches?

Objectives

Architecture: comparative analysis of instrumentation patterns

Prototype: reproducible images + deployment templates

Evaluation: controlled fault injection + overhead characterization

Methodology Overview

Design Science Research Approach:

Phase 1 Problem analysis + PRISMA literature review

Phase 2 Technology assessment and tool selection

Phase 3 Architecture specification + prototype implementation

Phase 4 Evaluation campaign with controlled fault injection

Phase 5 Analysis, thesis writing, defense preparation

Evaluation Strategy:

Quantitative: MTTD, MTTR, resource overhead, throughput

Qualitative: practitioner feedback via structured interviews

PRISMA Literature Review

PRISMA Summary

- 66** records identified (databases)
- 25** peer-reviewed studies included
- 18** industry sources retained

Project Plan and Timeline

Summary and Next Steps

Established

Problem framing: heterogeneous containerized CI/CD

PRISMA review: gaps identified

Methodology: execution plan defined

Next phase

Technology selection: constraint-driven

Prototype: architecture + implementation

Evaluation: controlled fault injection

Validation: practitioner feedback
